Kit per la determinazione colorimetrica dell'ammonio

Avvisi di pericolo: NH₄-1 contiene sodio idrossido soluzione 2–5%.

H314 Provoca gravi ustioni cutanee e gravi lesioni oculari.

Istruzioni per l'uso: vedasi anche il pittogramma sull'interno

- Risciacquare più volte il tubo col campione d'acqua e riempirlo fino al segno ad anello (5 mL).
- Aggiungere 10 gocce di NH₄-1 e mescolare agitando.
- Aggiungere 1 misurino pieno di NH₄-2 e disciogliere agitando. Attendere 5 min.
- Aggiungere 4 gocce die NH₄-3 e mescolare agitando.
- Dopo 5 min collocare il tubo sopra la scala colorata ed assegnare il valore dall'osservazione dall'alto. I valori intermedi possono essere stimati.

Questo metodo è applicabile anche per l'analisi dell'acqua di mare dopo diluizione (1+9).

Smaltimento: I campioni utilizzati per l'analisi possono essere immessi nelle canalizzazioni dotate di sistema di depurazione, mescolandoli con acqua di rubinetto.

Interferenze: I provini fortemente acidi e tamponati devono essere regolati su pH 9–10 con soda caustica prima dell'analisi. Le ammine primarie reagiscono come gli ioni di ammonio e causano risultati superiori ai valori effettivi. Le sostanze che consumano il cloro possono, a seconda della loro concentrazione, causare un risultato inferiore al valore effettivo o impedire del tutto la reazione.

Juego analítico para la determinación colorimétrica de amonio

es

Consejos de seguridad: NH₄-1 contiene hidróxido sódico 2–5%.

H314 Provoca quemaduras graves en la piel y lesiones oculares.

Instrucciones de uso: vea también el pictograma en el interior

- Lavar repetidamente el recipiente con la prueba del agua y llenarlo hasta la marca (5 mL).
- Añadir 10 gotas de NH₄-1 y mezclar agitando.
- Añadir 1 cuchara de medida rasa de NH₄-2 y disolver agitando. Esperar 5 min.
- Añadir 4 gotas de NH₄-3 y mezclar agitando.
- Después de 5 min colocar el recipiente sobre la escala de colores y asignar uno de los valores cromáticos. Los valores intermedios pueden interpolarse.

El método es adecuado también para el análisis de aguas marinas tras dilución (1+9).

Desechado: Los juegos de análisis usados pueden desecharse con agua de grifo a la canalización de la instalación de tratamiento de aguas residuales locales.

Interferencias: Las muestras muy ácidas o tamponadas deben ser reguladas a pH 9–10 con lejía de sosa antes de la determinación. Las aminas primarias reaccionan como iones de amonio y producen resultados con valores superiores. Los productos que consumen cloro pueden, dependiendo de la concentración, reducir el valor de medida o suprimir totalmente la reacción.

Testset voor de colorimetrische bepaling van ammonium

nl

Voorzorgsmaatregelen: NH₄-1 bevat natriumhydroxide-oplossing 2–5%.

H314 Veroorzaakt ernstige brandwonden en oogletsel.

Gebruiksaanwijzing: zie ook het pictogram op de achterzijde

- Testbuisje meermalen met het watermonster uitspoelen en tot de markeerstreep (5 mL) afvullen.
- 10 druppels NH₄-1 toevoegen en mengen door schudden.
- 1 afgestreken maatlepel NH₄-2 erbij doen en oplossen door schudden. 5 min wachten.
- 4 druppels NH₄-3 toevoegen en mengen door schudden.
- Na 5 min testbuisje op de kleurenschaal zetten en kleur vergelijken (van boven af door het buisje heen kijken). Tussengelegen waarden kunnen geschat worden.

De methode is ook bruikbaar voor de analyse van zeewater na verdunning (1+9).

Afvalverwerking: De gebruikte analyse-aanzetsels kunnen met leidingwater via de riolering naar de plaatselijke installatie voor afvalwaterbehandeling worden afgevoerd.

Storingen: Zeer zure of gebufferde oplossingen moeten voor de test aangepast worden naar pH 9–10 met natronloog. Primaire aminen reageren als ammoniumionen en maken, dat hogere waarden ontstaan. Chloorverterende stoffen kunnen naargelang van hun concentratie de meetwaarde verlagen of de reactie volledig onderdrukken.

Eliminaciones des échantillons : Les échantillons peuvent être utilisés pour l'analyse de l'eau de mer.

Eliminaciones des échantillons des échantillons : Des échantillons fortifiés avec des tampons doivent être utilisés pour l'analyse de l'eau de mer.

Apres 5 min placer le récipient sur l'échelle de couleurs et attribuer la valeur par l'inspection

5 min. Ajuster 10 gouttes de NH₄-3 et mélanger en agitant.

Mode d'emploi : Ajouter 1 cuillère de mesure remplie à ras bord de NH₄-2 et dissoudre en agitant. Attendre 5 min.

Mode d'emploi : Ajouter 4 gouttes de NH₄-1 et mélanger en agitant.

Mode d'emploi : Ajouter 1 cuillère de mesure remplie avec l'échelle de mesure à l'inverse.

H314 Provoque des brûlures de la peau et des lésions oculaires graves.

Indication de danger : NH₄-1 contient de l'hydroxyde de sodium 2–5%.

Indication de danger : NH₄-1 contient sodium hydroxide solution 2–5%.
